— Professional experience

2024 – Present

Independent Financial Coach FREELANCE

Self-employed · Berlin (remote · EN / TR)

- Run a one-to-one financial-coaching practice helping private clients build a calmer, more confident relationship with money — translating budgeting, saving and investing into plain, **actionable decisions**.
- Design an individual plan for each client and run **weekly check-ins**, pairing behavioural awareness with plain-language financial education rather than products or tips.
- Deliver sessions in **English and Turkish**, starting from a free intro call; refer clients to licensed advisers where regulated advice is needed (coaching and education, not regulated financial advice).

Dec 2022 – Sep 2023

Omnichannel Data Analyst

Viatrix Inc. · Remote (Germany)

- Consolidated healthcare-professional (HCP) and consent records from many regional sources into a **single master record per person** across a CRM + marketing platform spanning **70+ markets** (Salesforce Identity Hub) — large-scale data cleaning and entity resolution.
- Rebuilt duplicate / same-name matching with **fuzzy logic** and market-specific rules, cutting manual validation by up to **40%** and accelerating campaign readiness.
- Cleaned **1M+ consents and 100K+ HCP records**, improving campaign targeting and compliance on a global dataset.
- Extracted and analysed data with **SQL and Excel** to resolve missing opt-ins, duplicates and unmatched records; traced recurring data-quality issues to root cause with data, IT and marketing, and helped stand up AI/ML-assisted deduplication.

Dec 2021 – Oct
2022

Business Intelligence Analyst

Saksı Kampüs · Remote (Turkey) · early-stage edtech

- Tracked engagement, retention and content/tutor performance in **Google Analytics and Looker Studio**, and read Meta Ads results to steer acquisition spend — the core retention / engagement / CAC loop.
- Wrote the quantitative business plan, growth projections and pitch deck behind the company's **seed crowdfunding raise**.
- Identified demand for IB, SAT, TOEFL and IELTS programmes, contributing to a **~30% increase** in high-school student–tutor matches through new course offerings.
- Supported daily operations — tutor onboarding, user requests and internal documentation.

Jul 2021 – Sep
2021

Sales & Financial Analysis Intern

INTERNSHIP

Garanti BBVA Investment · İstanbul

- Built **DCF and comparable-company valuation** models and set target prices for sell-side equity research (incl. Şişecam).
- Analysed market trends, stock performance and sector news to support the sales team's coverage.

Jul 2019 – Sep
2019

Environmental Engineering Intern

INTERNSHIP

Aqwadem Consulting · Turkey

- Supported the feasibility assessment of a regional **wastewater and stormwater project** within an EU–Turkey (IPA) framework.
- Helped prepare IPA funding documents, tender files and environmental impact reports.

Aug 2016 – Sep
2016

Sustainability & Compliance Intern

INTERNSHIP

Coca-Cola (bottling plant) · Turkey

- Supported sustainability and compliance work — quality checks, MSDS updates and training materials to Coca-Cola standards.
- Helped coordinate suppliers and production teams on inventory reporting and ESG-related tasks.

— Education

2022 – 2024

M.Sc. Corporate Management

University of Europe for Applied Sciences · Berlin, Germany

- Master's thesis, *Revolutionizing Pharmaceutical Marketing with Generative AI* — developed into the published journal paper listed under Honors.

2013 – 2021

B.Sc. Environmental Engineering

Middle East Technical University (METU) · Ankara, Turkey

- Quantitative coursework in statistics, finance and modelling underpins the analytical work above.

— Data projects

Full analyses taken from raw, messy data to a clear recommendation — the question, the cleaning, the method and the call. Interactive write-ups on the portfolio. Synthetic-data studies are noted; the methods are real, the figures illustrative.

US Stock-Market Valuation & Risk

Python · OLS · SQL · Tableau

150+ years of real market data — does valuation predict long-run returns, and how much risk do you sign up for?

- Pulled Robert Shiller's price / earnings / **CAPE** series plus CBOE (VIX) and LBMA (gold) with a reproducible script; the cleaning call that mattered — recent months store 0.0 as a placeholder for unreported fundamentals, so I set those to missing rather than let them drag every average down.
- Built a forward 10-year real-return series in **SQLite** (a LAG window function to rank the best and worst years) and regressed forward returns on starting CAPE with **OLS in statsmodels**.
- Higher valuation tracks lower forward returns — statistically clear but $R^2 = 0.11$ (a real signal worth ~a tenth of the variation, not a market-timing tool); today's CAPE of 30.8 sits in the top 5% since 1881.
- Quantified the price of admission: real growth of only ~2.4%/yr once inflation is stripped, a worst real drawdown of -81% (trough June 1932), and a stock-gold correlation ≈ 0 — a genuine diversifier.
- Shipped as a Python notebook *and* an interactive **Tableau** dashboard on a star-schema export.

Pharmaceutical CRM Sales Analytics

Python · scikit-learn · SQL · Tableau

Do sales calls drive prescriptions, and where should a rep spend limited time across 600 physicians? A shareable version of my real Viatris CRM work — on synthetic data.

- Ran on a synthetic 600-physician CRM dataset from seeded scripts that deliberately inject real-world mess (duplicates, missing values, mixed date / text formats), so the cleaning steps are real, not decorative.
- Tested the call → prescription link with correlation and OLS, segmented doctors with **KMeans**, and built a ranked priority list with `RANK() OVER (PARTITION BY region ...)`.
- Calls move scripts — **$r = 0.49$** , about **+5.5 scripts per extra call** — and prescribing is concentrated (top 20% of doctors write ~a third of scripts), so *which* doctors a rep visits matters as much as how many.
- Isolated a **99-doctor "high-potential growth" segment** to prioritise; rep output ranged from 6,007 scripts down to 154 — a clear coaching signal. Turned "visit more doctors" into a ranked list of 99 to visit first.
- Shipped as a notebook plus a live **Tableau** sales-performance dashboard.

Free-to-Play Game Economy & Balance

Python · logistic reg. · z-tests · Tableau

Is the economy balanced, which items are overpowered, and who actually pays? On synthetic telemetry I generated myself.

- Diagnosed mild inflation (sinks recover ~**63%** of coins) and two statistically **overpowered** premium items — the Phoenix Blade at a 61% win rate, confirmed with proportion z-tests.
- Modelled retention **D1/D7/D30 at 47 / 18 / 4%**; only 5.8% of players ever pay, but predictably — a logistic model flags likely payers from their first three days at **AUC 0.80**, so live-ops effort can be aimed where it converts.
- The closest of my analyses to live-ops balancing: from exploit-grade items and currency inflation through to retention curves and payer prediction.
- Shipped as a notebook plus a **Tableau** "Game Economy Health" dashboard.

Idle Bank Tycoon — Economy Design Case Study

Excel · Google Sheets · A/B design

A self-directed, parameter-driven economy model and report built as an application case study — modelled on public estimates, not the studio's internal data.

- Reconstructed the income-vs-upgrade-cost curve over 60 bank levels with **400+ live formulas across 7 tabs** from a single source-of-truth tab, diagnosing a late-game cash glut.
- Designed two live-ops levers — a **Loan Desk** (a liquidity lock with a hard-currency sink) and income-scaled ad tuning — each with anti-inflation and retention guardrails, framed as **A/B tests** with assumptions kept transparently separate from data.
- Pencils out to a blended ~**+15.5% ARPDau** (ad tuning +23% sourced, +41.7% as a labelled modelled ceiling). The judgement I'd defend over the number: ship the lower-risk ad lever first, treat the loan as a retention bet to be *measured*.

— Game projects

Browser games I designed, coded, balanced and tested solo, on engines I wrote myself — built like production software. All playable; full write-ups on the portfolio.

Battle — turn-based RPG with online PvP

Vanilla JS · Supabase

A Pokémon-style RPG with story mode, persistent saves and real-time online multiplayer, on a custom engine built from the ground up — the project I've put the most into.

- A **hand-written vanilla-JS engine**: turn loop, move resolution and the status / hazard system all written by hand, no game framework, so I know exactly how every edge case resolves.
- An authoritative **Supabase / PostgreSQL backend with migrations** handles the hard part — two players acting on one shared, authoritative state, plus saved progress — where most of the engineering effort lives.
- A full story mode (catch, PC, Underground and Safari systems, boss arcs); HP and status restore between battles, but consumables only matter *inside* an encounter, so every fight is its own resource puzzle and rewards stay fair between strangers in PvP.
- Hardened like production software: performance profiling of the turn loop and memory, a central issue ledger with **spec-drift checks** against the design docs, and a PWA manifest.
- The part I'm proudest of — a test suite built on **deterministic replay**: the same seed reproduces a run exactly, so a bug someone hits once becomes a test I can replay forever.

RocketIO — real-time hex-grid strategy

Vanilla JS · Canvas · WebAudio

14 factions (70 units), a missile economy and adaptive AI on a procedurally generated map — tiles, units and sound all generated in code, no engine and no art assets.

- Real-time strategy on an **HTML5 Canvas** with almost nothing as a fixed asset: no image files, no pre-built maps, no recorded music — the game assembles its world in code at runtime.
- **Procedural maps** from gradient noise, tuned into recognisably different worlds (continents, archipelagos, inland seas), so strategy changes with the geography instead of a fixed board.
- A **missile economy** (factories build, launchers fire, anti-air intercepts) read through fog of war, with up to six **doctrine-driven AI** opponents that re-weigh their plans as the state shifts and can't memorise an opening.
- Tuned from data, not feel: a separate **balance-simulator** plays factions against each other headless; Vite bundles, Vitest + GitHub Actions run on every push, and the score is generated adaptively through WebAudio.

Vite · Vitest · CI

Bayram-Ziyareti — kinship logic puzzle

React · TypeScript

A Turkish family-tree puzzle where kinship terms are derived from the family graph, not stored — every placement is genuine deduction. Solver-checked, installable PWA.

- Kinship terms are computed from the family graph at runtime rather than stored, so the puzzle can't be memorised; a solver verifies every generated board is uniquely deducible.

React 18

TypeScript (strict)

PWA

Vitest

Top Trumps — card game with a card-counting AI

TypeScript · Playwright

Pass-and-play and three AI difficulties, with the game's rules kept separate from the screen so the whole thing is exhaustively testable. ~20 KB, zero runtime deps.

- The rules live in a pure module apart from the UI, so the game — including a card-counting hard bot — is fully unit- and end-to-end-tested under Vite and Playwright.

TypeScript (strict)
